Question **1**

Correct

A year Y will be passed as input. The program must find if the given year is a leap year or not.

- If it is leap year, the program must print yes else it should print no

**Note:** A year is a leap year if it is divisible by 4. If it is a century, then it should be divisible by 400.

The **pseudocode** is as given below:

if year is divisible by 400 then is\_leap\_year

else if year is divisible by 100 then not\_leap\_year

else if year is divisible by 4 then is\_leap\_year

else not\_leap\_year

**Example Input/Output:**

If 2000 is the input, the program must print yes

If 2100 is the input, the program must print no

If 2013 is the input, the program must print no

**Input Format:**

A year as a number is passed to the standard input.

**Output Format:**

The string value as per the conditions above printed to the standard output.

**Boundary Conditions:**

$0 < Y \leq 8000$

Input:

1980

Expected Output:

yes

**For example:**

Input	Result
1980	yes

**Answer:** (penalty regime: 0 %)

```
1 #include<stdio.h>
2
3 int main() {
4     int n;
5
6     scanf("%d", &n);
7     if (n%400 == 0) {
8         printf("yes");
9     }else if (n%100 == 0) {
10        printf("no");
11    } else if (n%4 == 0) {
12        printf("yes");
13    }else {
14        printf("no");
15    }
16
17    return 0;
18 }
```

	Input	Expected	Got	
✓	1980	yes	yes	✓

Passed all tests! ✓

Question **2**

Correct

An expression E is passed as an input to the program. The expression will contain three numbers A, B and C, one equal symbol and one of the mathematical operators + - \* /

But the given mathematical operator is incorrect and hence the expression is not valid. Hence the program must identify the correct operator and print that as the output.

**Input Format:**

First line will contain the expression E

**Output Format:**

First line will contain the correct mathematical operator

**Sample Input/Output:****Example 1:**

Input:

5-4=20

Output:

\*

Explanation:

Only 5 multiplied with 4 gives 20. Hence - must be replaced with \*.

**Example 2:**

Input:

999+9=111

Output:

/

Explanation:

Only 999 divided by 9 gives 111. Hence + must be replaced with /.

**For example:**

Input	Result
5-4=20	*
999+9=111	/

**Answer:** (penalty regime: 0 %)

```

1  #include<stdio.h>
2
3  int main() {
4      int a, b, c;
5      char sym, eq;
6
7      scanf("%d%c%d%c%d", &a, &sym, &b, &eq, &c);
8
9      if (a+b == c){
10         printf("+");
11     }else if(a-b == c){
12         printf("-");
13     }else if (a*b == c) {
14         printf("*");
15     }else {
16         printf("/");
17     }
18
19     return 0;
20 }
```

	Input	Expected	Got	
✓	5-4=20	*	*	✓
✓	999+9=111	/	/	✓

Passed all tests! ✓
